

ROP

복습...

지금 하려는 것.

puts("AA");

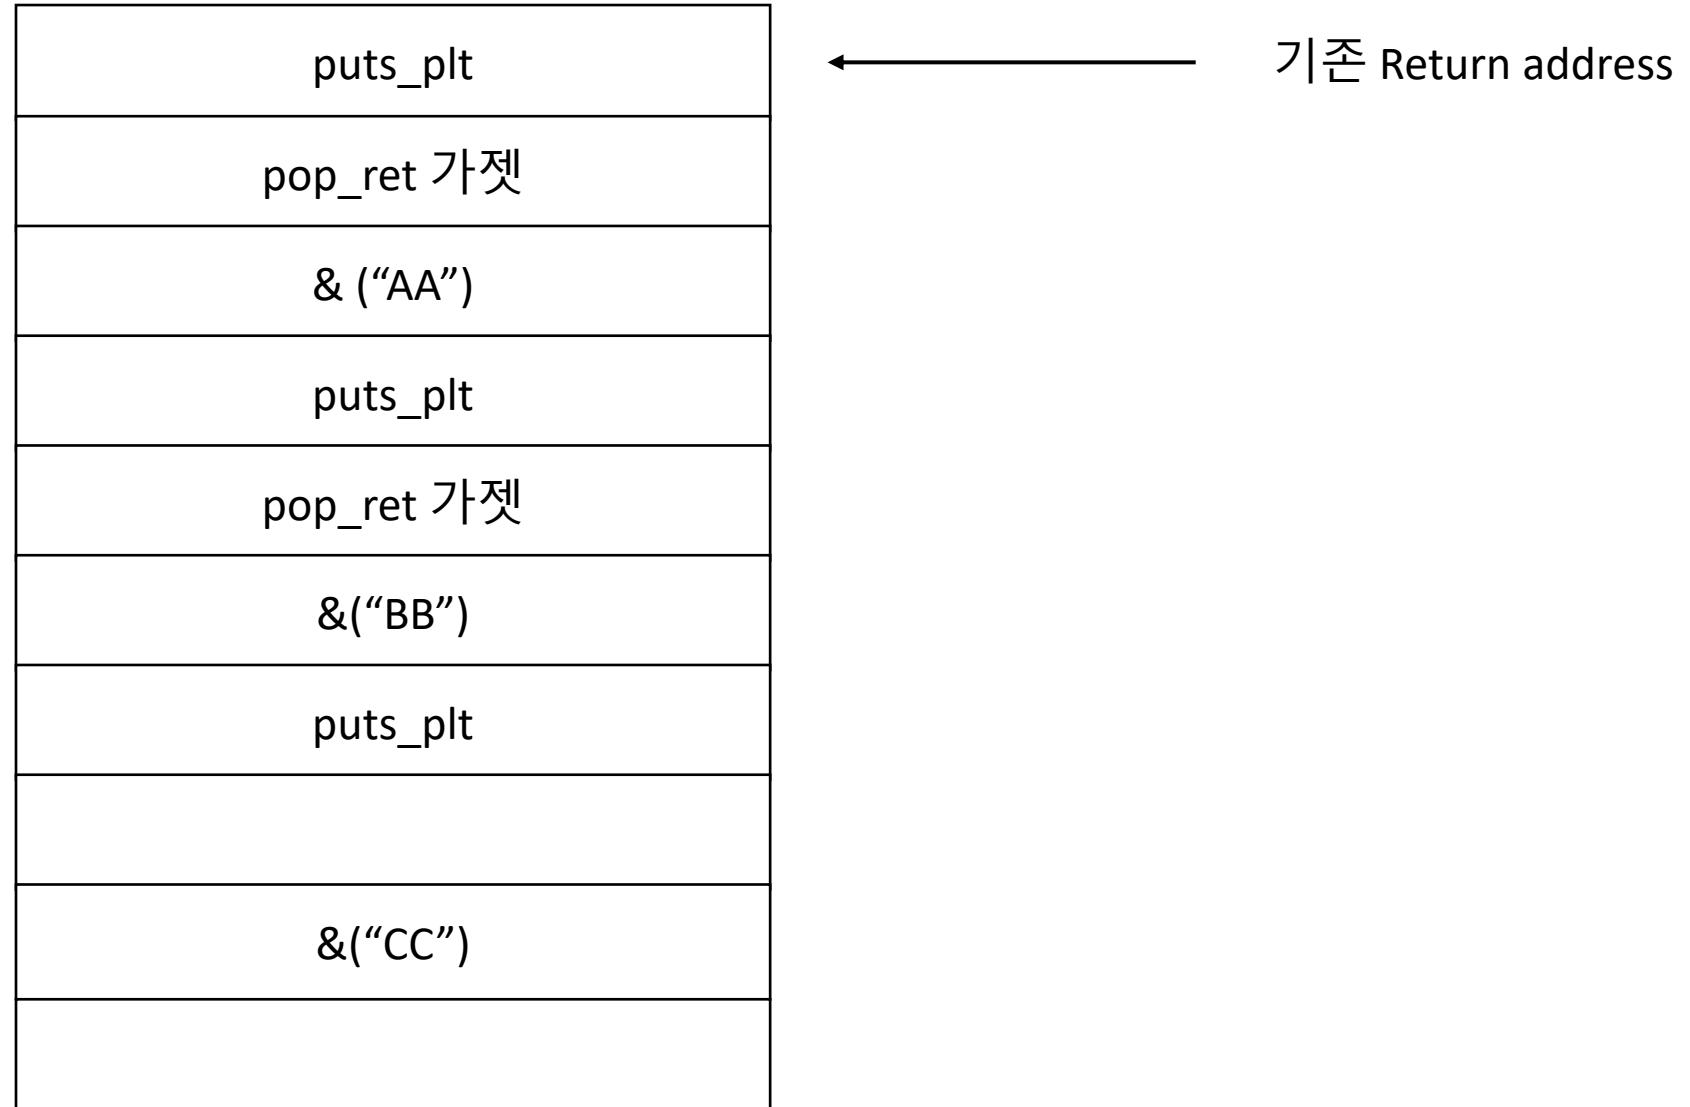

puts("BB");

복습...

지금 하려는 것.

```
puts("AA");  
puts("BB");  
puts("CC");
```

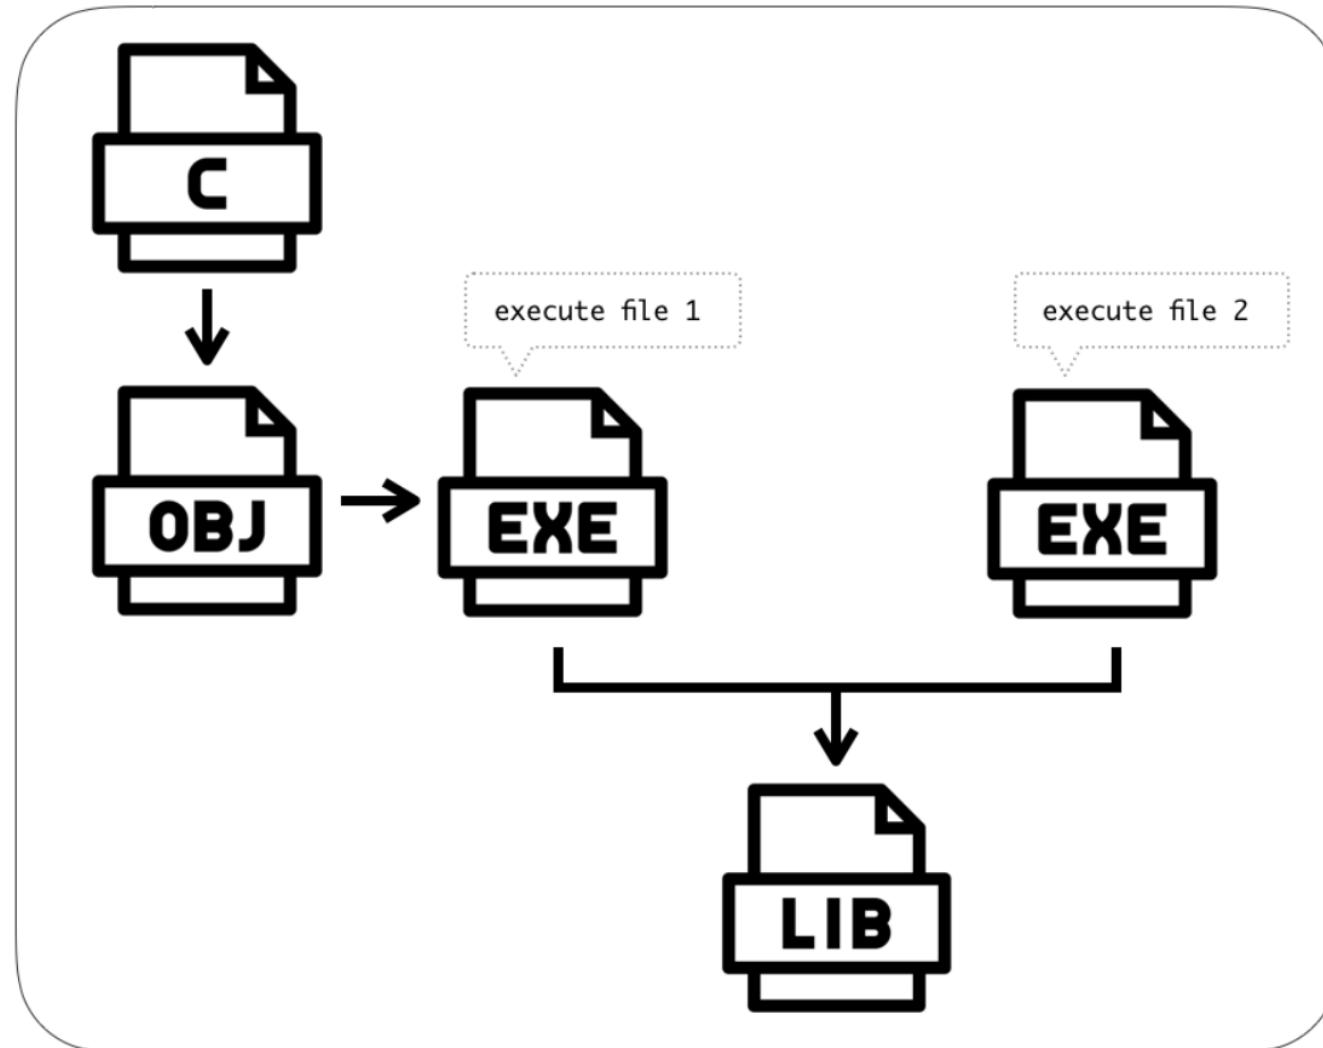

ROP

- 지난 시간에 배운 것을 이용한 공격 기법
- 지난 시간에 배운 것 + libc_leak + Got_overwrite

- 우리의 목표 => get _ shell
- 코드 내에서 사용된 함수만 plt / got 가 존재.
- 만약 system 함수가 없으면 어떡하지??

- 우리의 목표 => get _ shell
- 코드 내에서 사용된 함수만 plt / got 가 존재.
- 만약 system 함수가 없으면 어떡하지??
- 실제 주소를 찾자!!!

- Dynamic linking

- 1. libc_leak

목표 : libc_base를 구해야하는 것

- 1. libc_leak

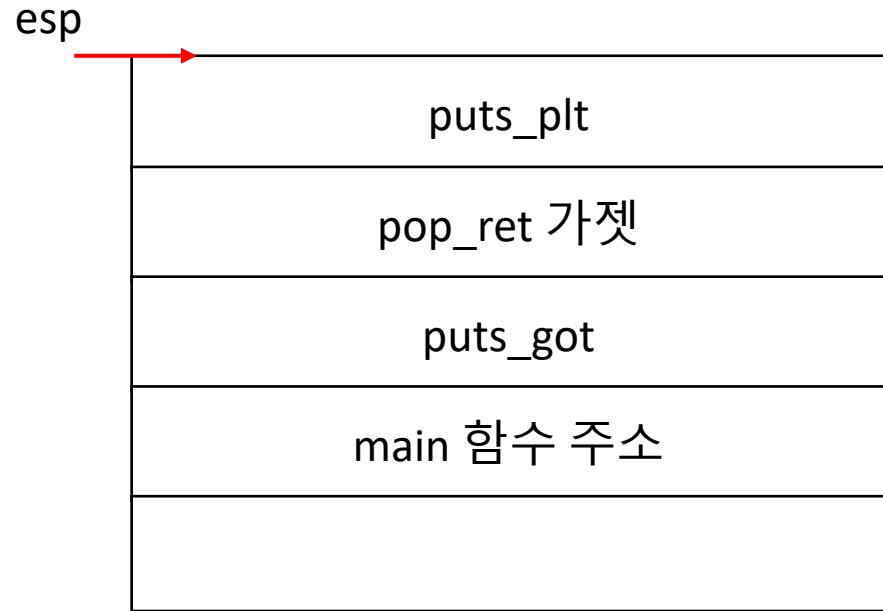

목표 : libc_base를 구해야하는 것

방법 : `put` / `write` / `printf` / ... 등등 출력 함수를 이용!!

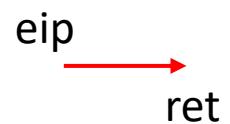

- puts(puts_got)??

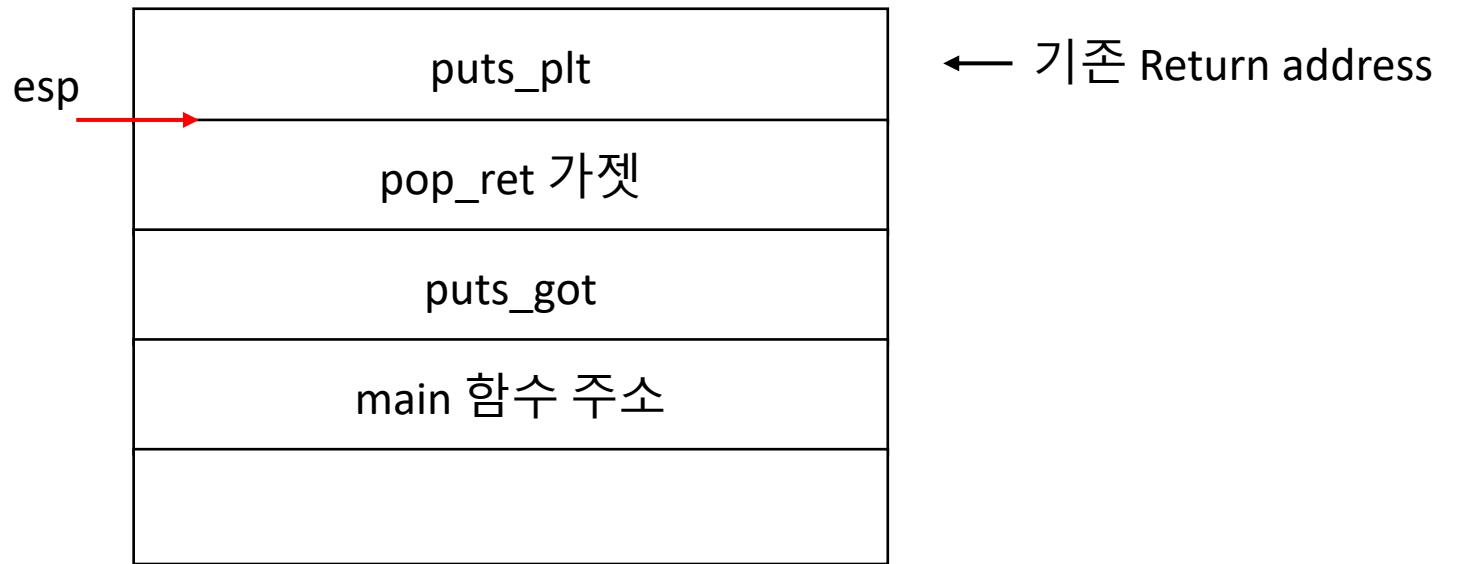

- puts(puts_got)??
- puts_got -> 실제 함수 주소(in libc)

- puts(puts_got)??
- puts_got -> 실제 함수 주소(in libc)
- => 실제 함수 주소 출력!!!! (libc_base leak)

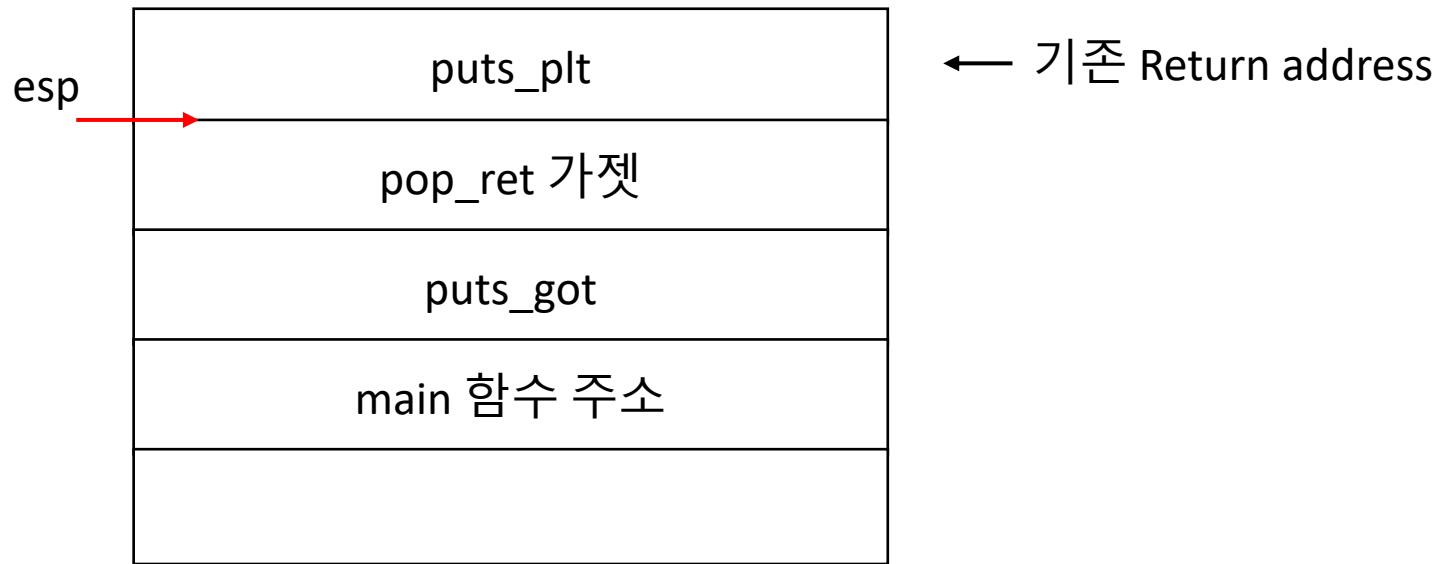

← 기존 Return address

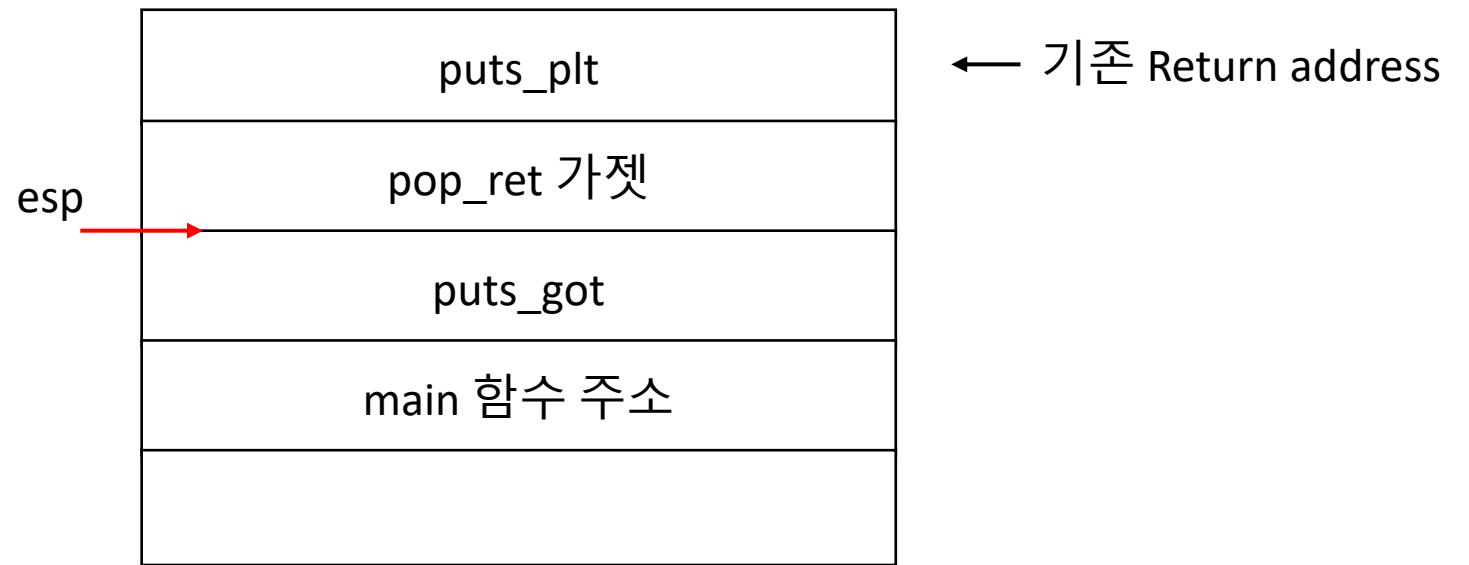

eip
→ puts() 함수

puts(puts_got); 실행과 동일!!

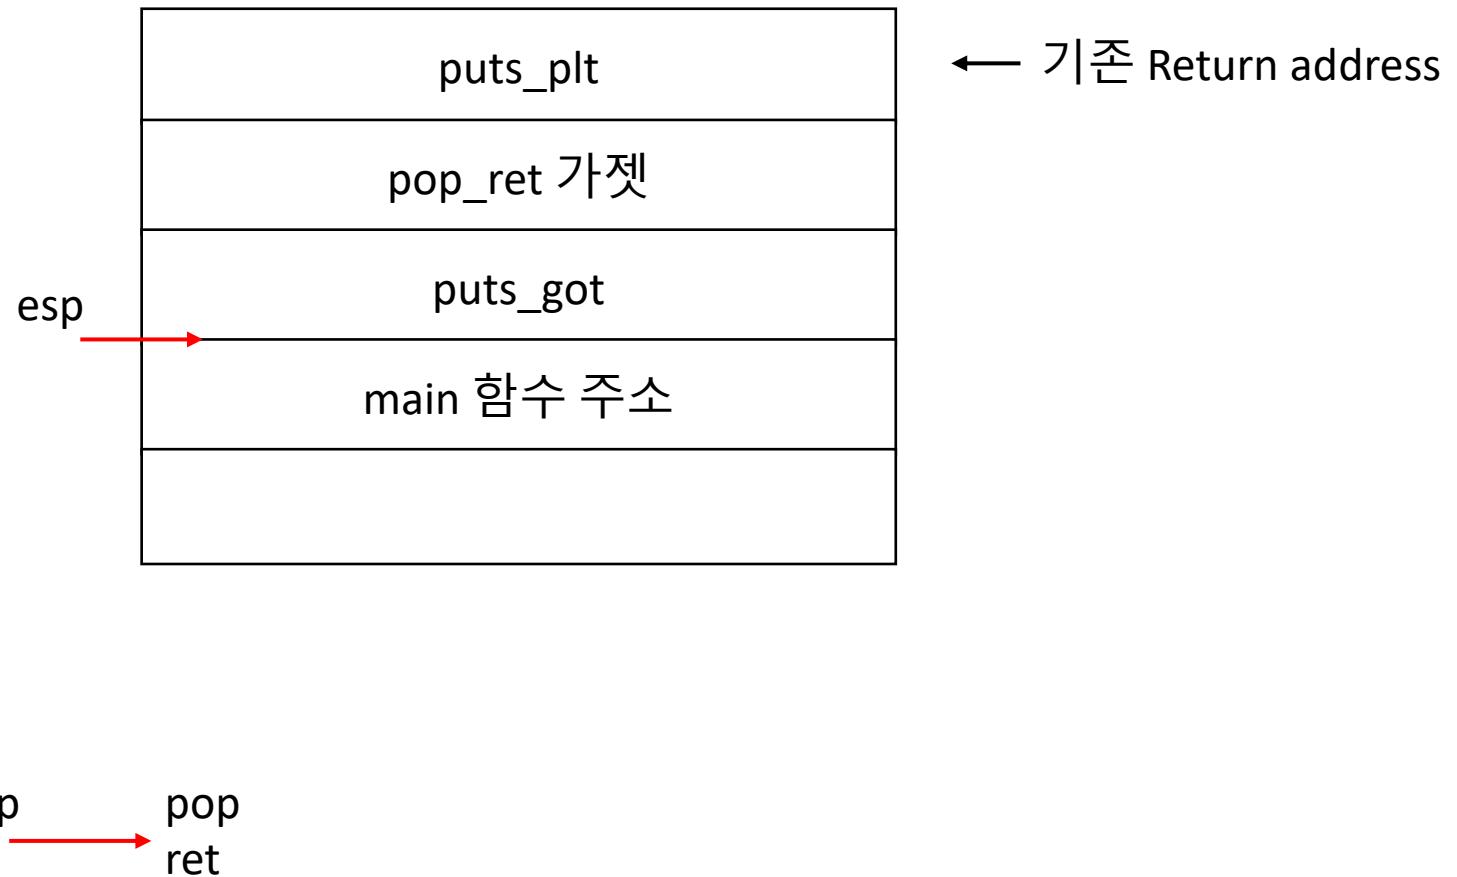

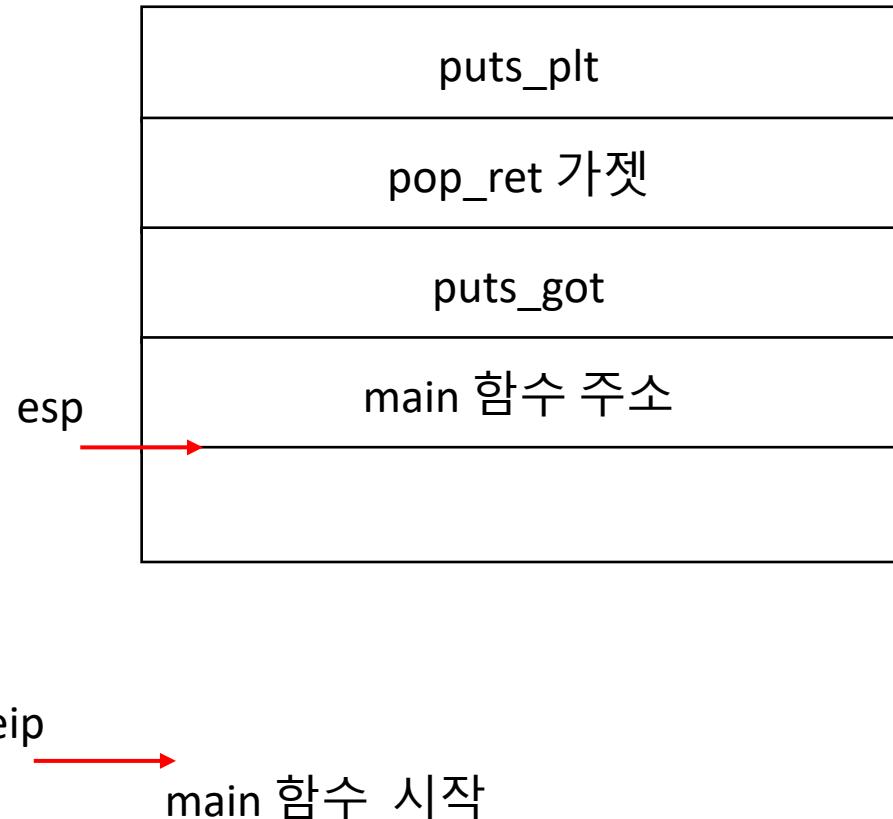

puts() 함수

eip
ret

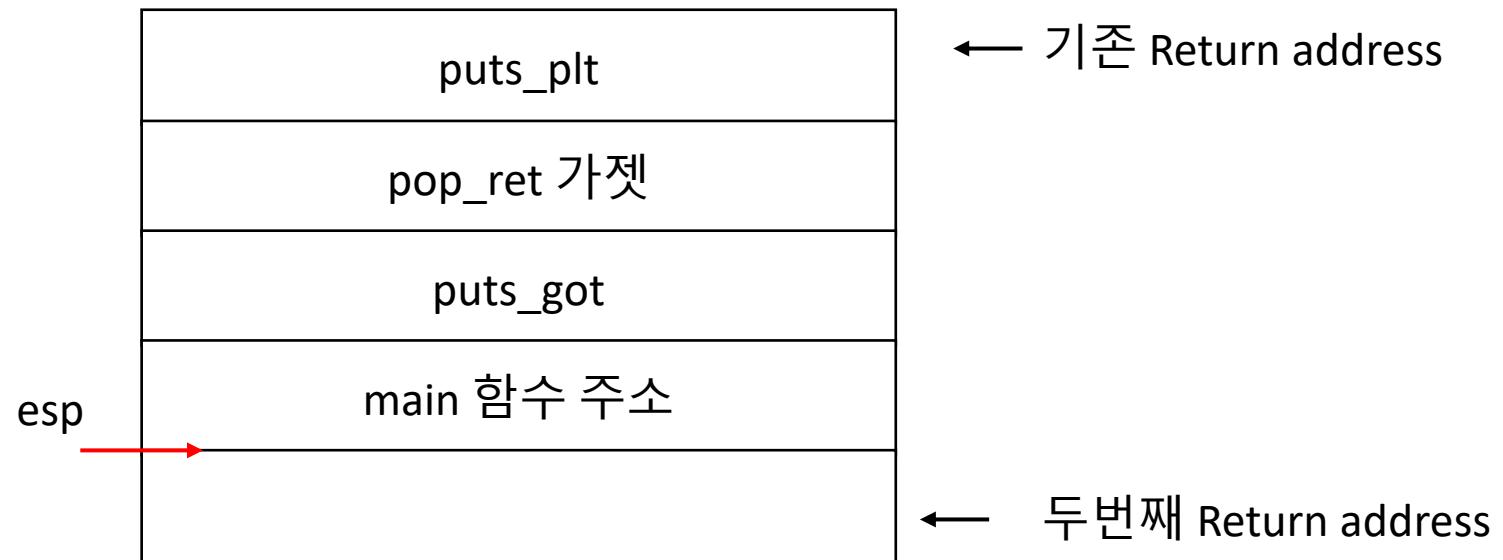

eip
→
pop
ret

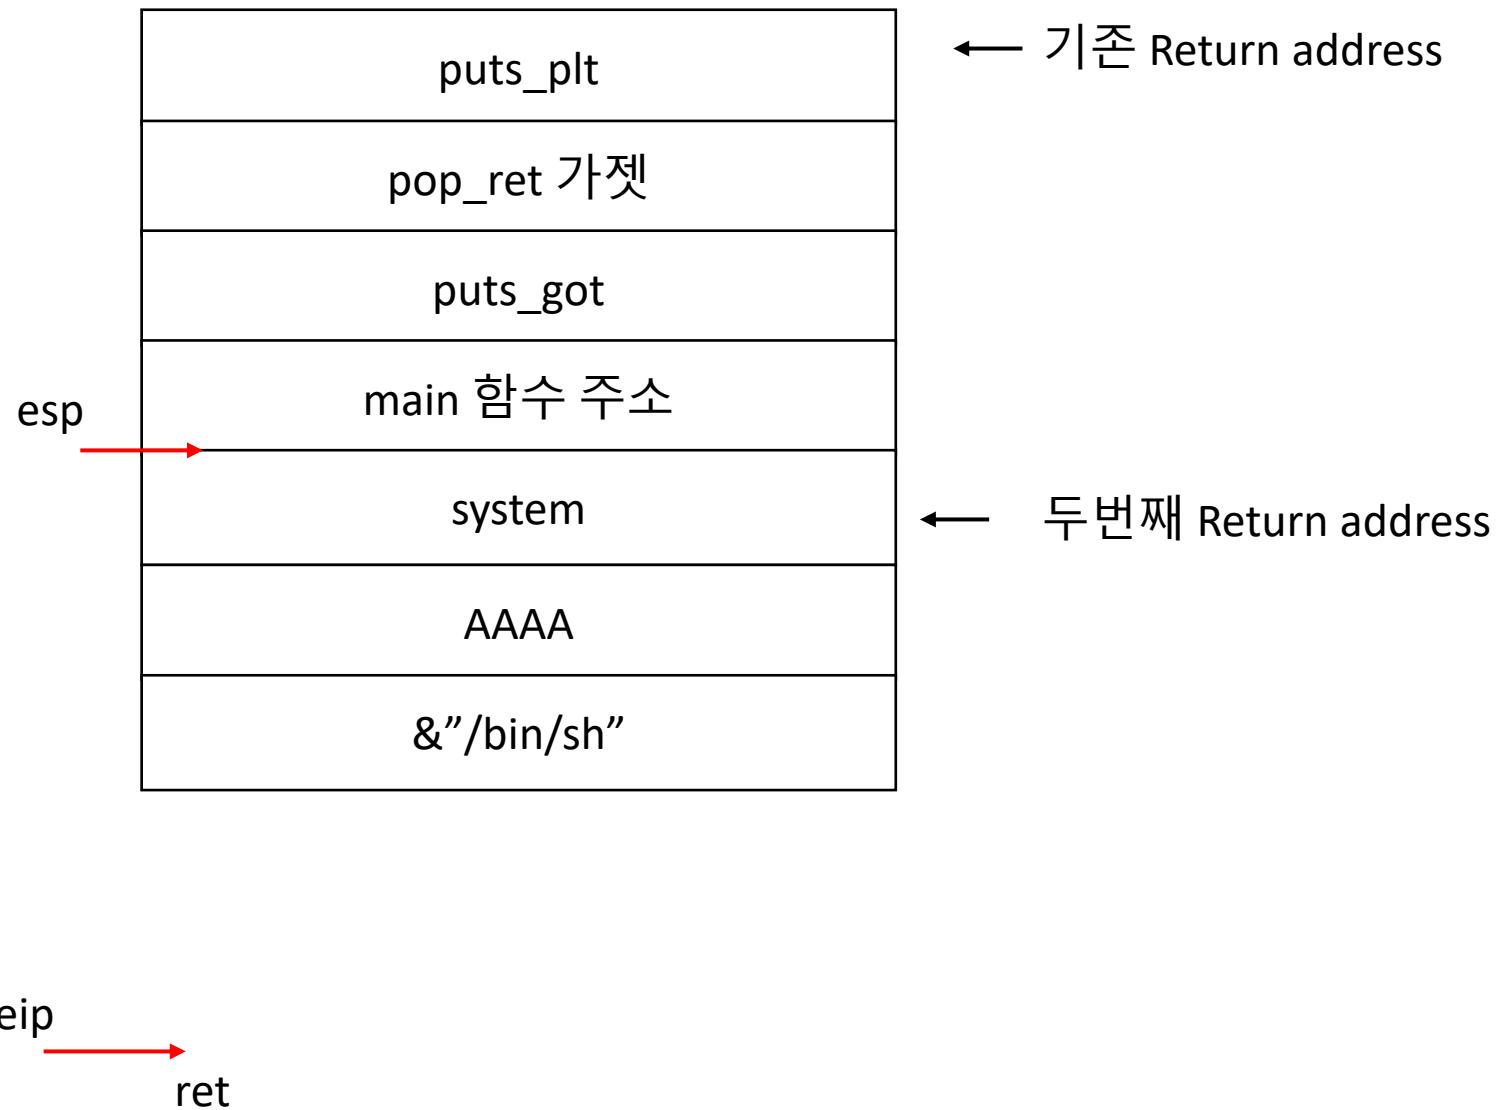

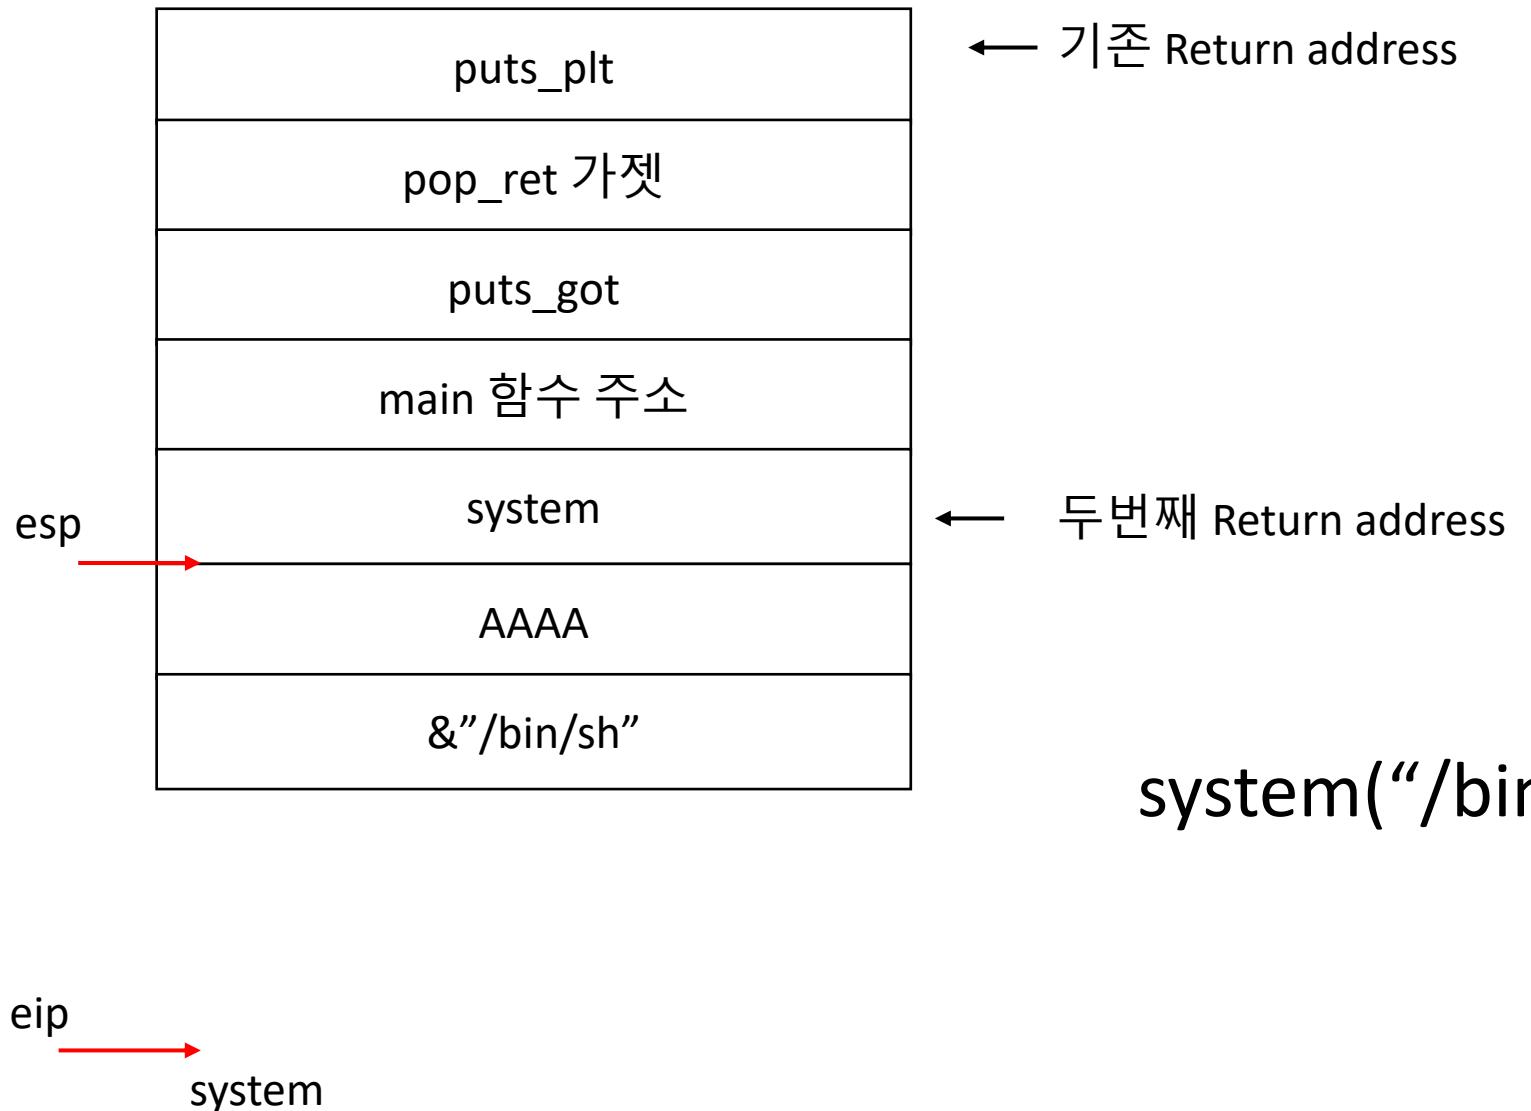

← 기존 Return address

main 함수 실행과 동일!!

eip
→
main 함수 시작

system("/bin/sh") 실행과 동일!!

32bit vs 64bit (x86 vs x64)

- 32bit : 함수가 매개변수를 스택에서 참조함
- 64bit: 함수가 매개변수를 “레지스터”에서 참조함

64bit rop

- 레지스터에 값들을 저장해 놓아야함..
어떤 레지스터??

rdi -> rsi -> rdx -> r10 -> r8 -> r9 ... 순서로 레지스터

64bit rop

rdi -> rsi -> rdx -> r10 -> r8 -> r9 ... 순서로 레지스터

ex)

read(0,buf,0x10);

rdi : 0

rsi : buf

rdx : 0x10

read(0,buf,0x10);

ret_addr 자리

pop rdi_ret 가젯
0
pop rsi_ret 가젯
buf
pop rdx_ret 가젯
0x10
read_plt
